Amendments to the Claims

Please amend claims 1, 7, and 11 as follows:

- 1. (Currrently Amended) A base station for a mobile radio system, including:
- a plurality of repeaters that provide respective radio channels;
- a station controller connected to each repeater; and
- a radio antenna system connected to the repeaters;

wherein the repeaters <u>initially</u> provide a control channel and a plurality of traffic channels for mobile users, the <u>station controller</u> base station being arranged to proactively re-allocate the <u>initially provided</u> existing control channel as a traffic channel and <u>re-allocate</u> one of the <u>initially provided</u> other traffic channels as a new control channel.

- 2. (Original) A base station according to claim 1, wherein: the control channel is changed periodically from one repeater to another in a round robin process.
- 3. (Original) A base station according to claim 1, wherein:
 the control channel is changed periodically or non-periodically among the repeaters in a random process.
 - 4. (Original) A base station according to claim 1, wherein:

each repeater normally provides a traffic channel and the control channel is changed intermittently among the repeaters according to a predetermined process skipping those repeaters at which the traffic channel is busy.

- 5. (Original) A base station according to claim 1, wherein:
- allocation of the control channel among the repeaters is determined by the station controller.
 - 6. (Original) A base station according to claim 1, wherein:

each repeater includes a channel controller and allocation of the control channel from one repeater to another is determined by respective channel controllers.

7. (Currently Amended) A method of providing radio channels in a mobile communication system, including:

initially allocating a control channel and a plurality of traffic channels for mobile radios in the system; and

proactively re-allocating the <u>initial</u> control channel as a traffic channel and one of the initial other traffic channels as a new control channel.

- 8. (Original) A method according to claim 7, further including:
 re-allocating the control channel among the traffic channels on a round robin basis.
 - 9. (Original) A method according to claim 7, further including: re-allocating the control channel among the traffic channels on a random basis.
- 10. (Original) A method according to claim 7, further including: selecting a channel for re-allocation of the control channel by determining a free traffic channel in a channel control system.

11. (Currently Amended) A method of re-allocating an initially assigned a control channel in a radio base station, including:

proactively selecting an <u>initially assigned</u> existing traffic channel to become a new control channel according to a predetermined process;

denying new requests by mobile radios over a current control channel for access to traffic channels;

completing existing requests by mobile radios over the current control channel for access to traffic channels;

proactively allocating the selected traffic channel as the new control channel and allocating the initially assigned eurrent control channel as a traffic channel; and

receiving new requests by mobile radios over the new control channel for access to traffic channels.

12. (Original) A method according to claim 11, wherein:

the predetermined process includes a round robin poll of traffic channels to locate a channel not currently busy with traffic.

- 13. (Original) A method according to claim 12, wherein: the poll takes place at periodic or random intervals.
- 14. (Original) A radio network including a base station that implements a method according to claim 7.
- 15. (Original) A radio network including a base station that implements a method according to claim 8.

- 16. (Original) A radio network including a base station that implements a method according to claim 9.
- 17. (Original) A radio network including a base station that implements a method according to claim 10.
- 18. (Original) A radio network including a base station that implements a method according to claim 11.
- 19. (Original) A radio network including a base station that implements a method according to claim 12.
- 20. (Original) A radio network including a base station that implements a method according to claim 13.
